

Great question. I will explain everything in very simple English. Step by step.

1. How to Add a New Project

Open index.html. Find this section:

```
html

<!-- ===== PROJECTS SECTION ===== -->
```

You will see cards like this:

```
html

<article class="project-card">
  <h3>Project Title</h3>
  <p>Short project description goes here.</p>
  <p class="project-tech">Technologies: HTML, CSS, JavaScript</p>
  <a href="https://github.com/Asterix7339" ...>View on GitHub</a>
</article>
```

To add a new project — just copy one card and paste it below. Then change the text.

```
html

<article class="project-card">
  <h3>My New Project</h3>                ← change title
  <p>This project does this and that.</p>  ← change description
  <p class="project-tech">Technologies: Python, Django</p> ← change tech
  <a href="https://github.com/Asterix7339/new-repo" ...>View on GitHub</a> ← change
</article>
```

The grid automatically adjusts. No CSS changes needed.

2. How to Add a New Skill

Find the Skills section in index.html.

To add a skill to an existing group — just add a new :

```
html
<div class="skill-group">
  <h3>Programming Languages</h3>
  <ul>
    <li>Python</li>
    <li>JavaScript</li>
    <li>Java</li>      ← just add this line
  </ul>
</div>
```

To add a whole new skill group — copy one skill-group block and paste it:

```
html
<div class="skill-group">
  <h3>Databases</h3>      ← new category name
  <ul>
    <li>MySQL</li>
    <li>MongoDB</li>
  </ul>
</div>
```

Again — no

CSS changes needed. Grid handles it automatically.

3. How to Change Your Profile Photo

Step 1 — Create a folder called assets inside your project folder.

```
portfolio/
  assets/      ← create this folder
  index.html
  style.css
  script.js
```

Step 2 — Put your photo inside assets/ and name it exactly:

profile.jpg

Step 3 — Done. The HTML already points to that file:

src="assets/profile.jpg"

Important tips for your photo:

- Use a clear photo of your face — professional, good lighting

- Square photo works best (example: 500×500 pixels or 800×800 pixels)
- Keep file size under 300KB for fast loading
- Supported formats: .jpg or .png

4. How to Change Personal Information

All personal text is inside index.html. Just find it and change it.

What to change	Where to find it
Your name	Mohamed Satham in Hero section
Job title	Full Stack Developer in Hero section
Introduction	<p>I am a Software Engineering... in Hero section
Biography	Inside #about section
Phone number	 in Contact section
Email	Replace "Coming soon" text in Contact section
LinkedIn	Replace "Coming soon" text with your LinkedIn URL
GitHub link	Change https://github.com/Asterix7339 to your link
Footer year	© 2025 Mohamed Satham in Footer

5. How to Add Your Resume

Step 1 — Put your resume PDF inside the assets/ folder:

assets/resume.pdf

Step 2 — Find this line in index.html:

```
<a href="#" aria-disabled="true">Download Resume (Coming Soon)</a>
```

Step 3 — Replace it with:

```
<a href="assets/resume.pdf" download>Download Resume</a>
```

Done. Visitors can now download your resume.

6. Professional Maintenance Rules

Think of your portfolio like a garden. Small care regularly keeps it healthy.

Every time you finish a project

- Add it to the Projects section
- Update your Skills section if you used new technologies

Every 3 months

- Read your About section — does it still describe you correctly?
- Check all links — GitHub, LinkedIn, phone, email — make sure they work
- Update your resume file if anything changed

Every 6 months

- Check if your photo still looks professional
- Remove old or weak projects — quality is better than quantity
- Add new certifications or achievements to Education section

Every time you learn something new

- Add the new skill to the correct skill group immediately
 - Do not wait — small updates are easier than big ones later
-

7. How to Save and Publish Changes

Every time you change something, follow these steps:

Step 1 — Save the file (Ctrl + S)

Step 2 — Open terminal in your project folder

Step 3 — Type these commands:

```
git add .
```

```
git commit -m "Added new project: Project Name"
```

```
git push
```

Vercel automatically detects the push and updates your live website. You do not need to do anything extra after git push.

Simple Golden Rules

Rule	Why
Never delete old code — comment it out first	Easy to undo mistakes
Always test in browser before pushing	Catch errors early
Write a short commit message describing what you changed	Easy to find changes later
Keep photo file size small	Website loads fast
Update portfolio before applying for jobs	Recruiters check it

You are now fully equipped to maintain this professionally. The structure was built so that **every future change is just copy, paste, and edit text.** No complex coding needed for routine updates.
